Mastering Geospatial Monitoring and Evaluation

A Practical Course for Evaluators

About this course

Traditional evaluation approaches often overlook the immense potential of GIS and remote sensing technologies. In fact, 80% of academic evaluation courses lack training in these technologies*. This course, which is currently in development, will empower M&E professionals to integrate spatial thinking and utilise Earth Observation (EO) datasets to more effectively measure the impact of development projects.

Target audience

Monitoring and evaluation (M&E) professionals evaluating land-based projects (e.g. irrigation, forestry, natural resources, water)

Course format

Hybrid/workshop | 3 Days in duration | Hands-on, case-study based learning

You will learn

- Finding and recording geospatial intervention data
- Choosing the best EO datasets to measure change
- Knowing when and how to engage GIS and/or EO specialists
- Deciding whether to develop new EO products or leverage free, existing ones

Course modules

1

Monitor what, where and when

- Learn to identify, record, source, and review geospatial asset data.
- Understand data collection requirements/standards
- Gain proficiency in geo-surveying and analysis tools (e.g. QGIS)

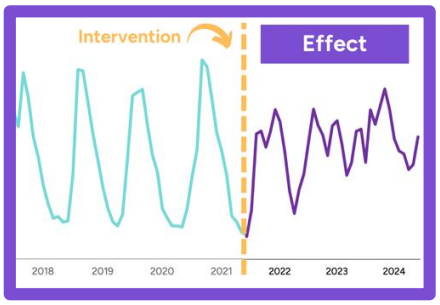

2

Verify project assets with high-resolution imagery

- Discover sources of free and commercial high-resolution imagery to view assets before and after interventions

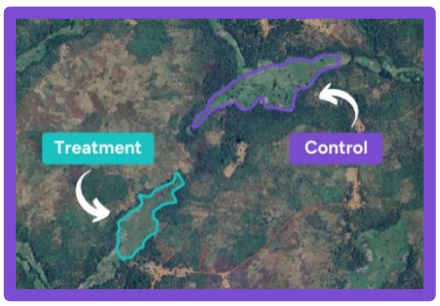

3

Measure effect and impact with satellite-based variables

- Define geospatial units of observation
- Establish timeframes for baseline and endline comparisons
- Formulate EO hypotheses
- Select appropriate EO datasets

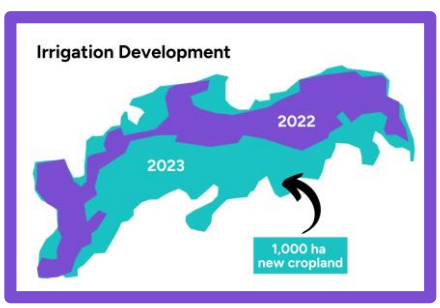

4

Use geospatial approaches to sample sites

- Define and extract control groups
- Compile inputs for econometric modeling

5

Communicate findings

- Create compelling visuals and graphs for evaluation reports
- Develop simple web-maps
